★

The parents of a 2 month old male bring him to the emergency department. His parents inform you that he has a history of irritability. He has developed recurrent vomiting and choking while feeding. You ask the parents about the child's stools, to which they respond by saying that he has been going less frequently, but there are no noticeable changes in the stool itself. Of the following choices, which is the most likely cause?

- A. Pyloric stenosis
- B. Meningitis
- C. Hirschsprung's disease
- D. Gastroesophageal reflux disease
